Reproducible Research for OMNeT++ Based on Python and Pweave

Kyeong Soo (Joseph) Kim
Department of Electrical and Electronic Engineering
Xi'an Jiaotong-Liverpool University

07 September 2017

Outline

- Reproducible Research
- Python and Pweave
- Reproducible Research for OMNeT++
- Example: OMNeT++ FIFO Simulation

Reproducible Research

Reproducible Research

- Reproducible research is a key to any scientific method and ensures repeating an experiment and the results of its analysis in any place with any person.
- A study can be truly reproducible when it satisfies at least the following three criteria:
  - All experimental methods are fully reported.
  - All data and files used for the analysis are (publicly) available.
  - The process of analyzing raw data is well reported and preserved.
- Reproducible research is to ensure
  - Same data + Same script = Same results

Why Do We Need Reproducible Research: Two Examples

- LIGO - Gravitational Wave Detection
- Schön scandal - Molecular Computing

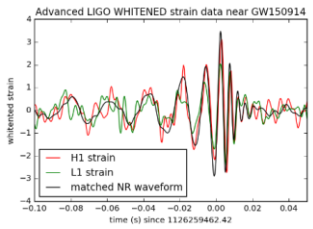
LIGO - Gravitational Wave Detection

- The *Laser Interferometer Gravitational-Wave Observatory (LIGO)* is a large-scale physics experiment and observatory to detect cosmic gravitational waves.
  - The detection of gravitational wave was reported in *Physical Review Letters* in Feb. 2016, together with ipython notebook with analysis code and data.

In [9]:
```
# We need to suppress the high frequencies with some bandpassing:
bb, ab = butter(4, [20.*2./fs, 300.*2./fs], btype='band')
strain_H1_whitenbp = filtfilt(bb, ab, strain_H1_whiten)
strain_L1_whitenbp = filtfilt(bb, ab, strain_L1_whiten)
NR_H1_whitenbp = filtfilt(bb, ab, NR_H1_whiten)

# plot the data after whitening:
# first, shift L1 by 7 ms, and invert. See the GW150914 detection paper
strain_L1_shift = -np.roll(strain_L1_whitenbp,int(0.007*fs))

plt.figure()
plt.plot(time-tevent,strain_H1_whitenbp,'r',label='H1 strain')
plt.plot(time-tevent,strain_L1_shift,'g',label='L1 strain')
plt.plot(NRtime+0.002,NR_H1_whitenbp,'k',label='matched NR waveform')
plt.xlim([-0.1,0.05])
plt.ylim([-4,4])
plt.xlabel('time (s) since '+str(tevent))
plt.ylabel('whitented strain')
plt.legend(loc='lower left')
plt.title('Advanced LIGO WHITENED strain data near GW150914')
plt.savefig('GW150914_strain_whitened.png')
```



Schön Scandal - Molecular Computing

- No records found for his ground-breaking experimental results, including lab notebook, experimental samples and data, hard disk drives.
- During the investigation, he kept repeating ***"I clearly observed them in the Lab but …"***

Bell Labs launches inquiry into allegations of data duplication

Misconduct finding at Bell Labs shakes physics community

Bell Labs inquiry spreads to superconductors

commentary

Is a bell tolling for Bell Labs?

Python and Pweave

R/Sweave to Python/Pweave

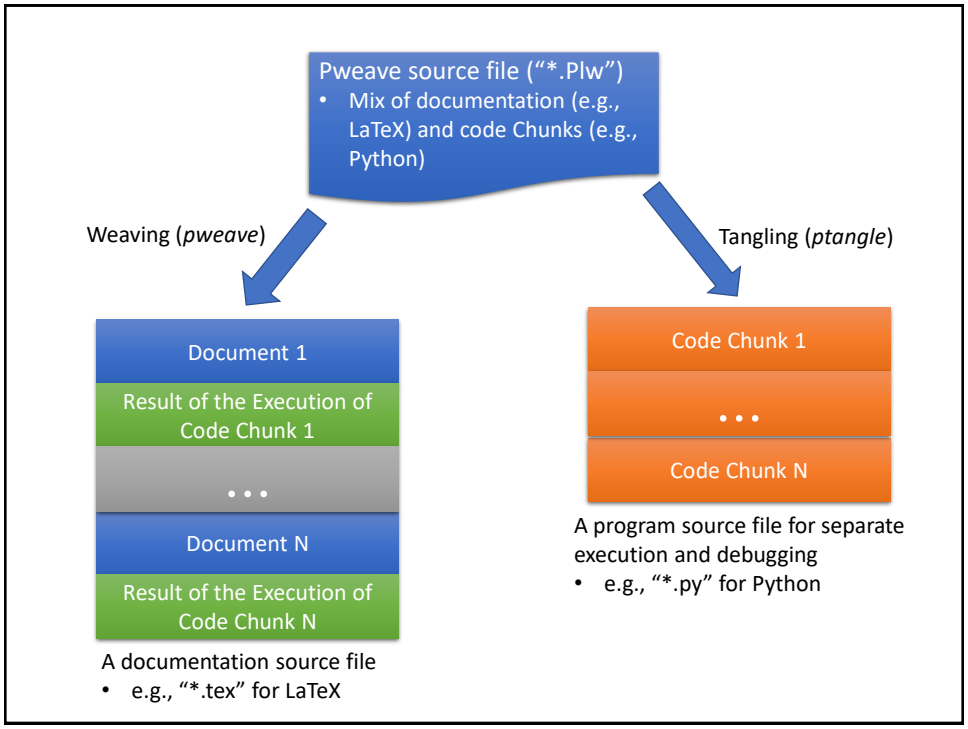
- Until recently, R was the language of choice for statistical processing and data analysis.
  - Still, R has the largest code base for a wide variety of statistical and graphical techniques.
- Like *ipython* (now *jupyter*), R provides a nice tool called *Sweave* (now replaced by *knitr*) to weave documentation and the results of the execution of R code chunks into one source file for integrated documentation.
- Python — one of the most popular languages in scientific computing, including artificial intelligence & machine learning — recently takes over R in statistical processing and data analysis as well.
  - Thanks to *pandas* implementing DataFrame object similar to R and *Pweave*, python can replace R for most statistical and data analysis tasks, while retaining its many advantages over R (i.e., fully-featured programming language with easy syntax and higher speed).

```
### customize
.old <- theme_set(theme_bw())
.pt_size <- 3.5

### generate summary plots for reference architecture with N=1
.rf_N1.data <- paste(.rf_N1.wd, paste(.rf_N1.base, "data", sep="."), sep="/")
.df <- read.csv(.rf_N1.data, header=TRUE)
## .df <- .df[order(.df$N, .df$n, .df$dr, .df$br, .df$repetition), ] # order data frame
.df <- sort_df(.df, vars=c("N", "n", "dr", "br", "repetition"))   # sort data frame
.rf_N1.df <- ddply(.df, c(.(n), .(dr)), function(df) {return(GetMeansAndCiWidths(df))})
.rf_N1.plots <- list()
for (.i in 1:7) {
    .df <- subset(.rf_N1.df, select = c(1, 2, (.i*2+1):((.i+1)*2)))
    names(.df)[3:4] <- c("mean", "ci.width")
    .limits <- aes(ymin = mean - ci.width, ymax = mean +ci.width)
    .p <- ggplot(data=.df, aes(group=dr, colour=factor(dr), x=n, y=mean)) + geom_line() + sca
‹.width)))
    .p <- .p + xlab("Number of Users per ONU (n)") + ylab(.labels.measure[.i])
    ## .p <- .p + geom_point(aes(group=dr, colour=factor(dr), x=n, y=mean), size=.pt_size)
    .p <- .p + geom_point(aes(group=dr, shape=factor(dr), x=n, y=mean), size=.pt_size) + scale
    .p <- .p + geom_errorbar(.limits, width=0.1) + scale_colour_discrete("Line Rate\n[Gb/s]")
    .rf_N1.plots[[.i]] <- .p
}
```

Snippets of R Source Code and Sweave File for LaTeX

```
\subsection{Hybrid PON}
%%%
%%%
%%% tables for dedicated access
%%%
%%%
<<echo=F,results=tex>>=
.df <- subset(.hp.df, select=c(1:8))
names(.df)[3:8] <- c(
"dly.mean", "dly.ci.width",
"thr.mean", "thr.ci.width",
"trf.mean", "trf.ci.width"
)
.tabledf <- xtable(.df, caption="Peformance measures of FTTP traffic
digits(.tabledf)[2:9] <- c(0, 1, rep(-4, 6))
print(.tabledf,
      tabular.environment="longtable", caption.placement="top",
      include.rownames=FALSE, floating=FALSE, NA.string="NA")
@
```



Weaving Example: Automatic Table Generation

The following Python code chunk can automatically generate a long table over multiple pages from a pandas dataframe[1]:

```
<<echo=False,results='raw'>> =
import numpy as np
df = fifo_df.filter(regex="^(?!(r|R)un).*$")  # exclude columns starting with run/Run
print(df.to_latex(longtable=True))
@
```

Weaving & LaTeXing

The following Python code chunk can automatically generate a long table over multiple pages from a pandas dataframe[1]:

```
<<echo=False,results='raw'>> =
import numpy as np
df = fifo_df.filter(regex="^(?!(r|R)un).*$")  # exclude columns starting with run/Run
print(df.to_latex(longtable=True))
@
```

Continued on next page

[1]Note that a space is inserted between '*' and '=' to prevent Pweave from weaving the code; it seems that there is no way to escape Pweave chunk code markers.

Reproducible Research for OMNeT++

How to Deal with Simulation Input Files

- Include them the document.
  - OK for small simulations
- Use a snapshot of the whole configurations.
  - e.g., git commit hashes

```

```
commit 857ae37cd233914fd7271584afc4be10bcf75a61
Author: Kyeong Soo (Joseph) Kim <kyeongsoo.kim@gmail.com>
Date:   Mon Feb 27 08:59:31 2017 +0000

    Add ini file.

commit f1e7f6ad0265068d906efd02026e774076c00297
Author: Kyeong Soo (Joseph) Kim <kyeongsoo.kim@gmail.com>
Date:   Mon Feb 27 08:56:07 2017 +0000

    Remove README.rst; only the markdown version of README

commit 8765336f9e2f5543fea8c4f37a0cf894da7f4c8e
Author: Kyeong Soo (Joseph) Kim <kyeongsoo.kim@gmail.com>
Date:   Sun Oct 2 17:32:02 2016 +0000

    Change simulation time.
```

How to Guarantee Match Between Input Files and Output Data

- Online generation of results
  - Include simulation execution code within a document
    - Refer to the provided sample Pweave file.
  - OK for smaller simulations, but not for larger simulations.
- Use a snapshot of the whole configurations and data
  - e.g., git commit hashes
  - Version controlling output data together with source code and input configuration files, however, may greatly increase the size of a repository.

How to Present and Analyze Output Data

- Unstacking of stacked DataFrame
  - Use *pivot* function (see the example shown here).
- Aggregated processing of measurement data over independent variables
  - Use *pivot_table* function.
  - Useful for the calculation of mean and confidence intervals over multiple iterations.
- Online calculation of confidence intervals
  - Confidence intervals (CIs) can be calculated by assigning a custom function for CI to *aggfunc* paramenter of *pivot_table* function.
  - Now pandas support error bars in its own plot functions.

```
